qstring is a Python library that allows you to create nested objects from a list of querystring parameters.

# CHAPTER 1

---

## Installation

---

Use pip to install from PyPI:

```
pip install qstring
```

# CHAPTER 2

---

## Contributing

---

To contribute to qstring create a [fork](#) on GitHub. Clone your fork, make some changes, and submit a pull request.

# CHAPTER 3

---

## API Documentation

---

`qstring.nest (params)`

Create a nested object from a list of query string parameters.

Examples:

```
>>> nest([('foo[bar]', 'baz')])
{'foo': {'bar': 'baz'}}
```

  

```
>>> nest([('x[y]', '1'), ('x[y]', '2')])
{'x': {'y': ['1', '2']}}}
```

**Parameters** `params` – a list of query string parameter where each item is a tuple representing a key-value pair.

**Raises** `qstring.ParameterTypeError` – if parameters of conflicting types are given.

`qstring.unnest (obj)`

Create a list of query string parameters from a nested object.

Examples:

```
>>> unnest({'foo': {'bar': 'baz'}})
[('foo[bar]', 'baz')]
```

  

```
>>> unnest({'x': {'y': ['1', '2']}})
[('x[y]', '1'), ('x[y]', '2')]
```

**exception** `qstring.ParameterTypeError`

This error is raised when `nest ()` encounters parameters with conflicting types.

# CHAPTER 4

---

## Changelog

---

### 0.2.1 (March 24, 2017)

- Fixed `qstring.unnest` when values contain non-ASCII characters.

### 0.2.0 (September 1, 2015)

- Changed `qstring.nest` to maintain the order of the given parameters in the returned nested object by returning `OrderedDict` instead of `dict`.

### 0.1.0 (July 14, 2015)

- Initial public release.
